

Individual reflection 4

What do I want to learn or understand better? Consider e.g. teamwork, Scrum, agile processes, technologies etc?

I have begun working on the front-end styling, but I realize there is still much to learn. I aspire to create an aesthetically pleasing design that adheres to specific patterns. However that increases the complexity of the front-end development. Additionally, I am also looking to enhance my knowledge of the backend and determine the most efficient ways to factorize code. For instance, deciding whether to include code in a class remains a challenging task for me.

What is my contribution towards the team's deliveries? How can I help my team do better next sprint?

I have completed front-end tasks and done some back-end refactorization, both of which were essential for the project. However, I believe that I can further assist my team by collaborating more closely with them. During the last sprint, I mostly worked independently, which is less productive than teamwork. Thus, when the next refactorization is necessary, I plan to work collaboratively with the team to exchange ideas and explore different approaches.

Changes/improvements from last week's reflection?

This sprint was less demanding compared to the previous ones, allowing us to better assess the team's capacity for work. By taking on fewer points this time, we gained a better understanding of our team's capabilities and learned to balance the workload effectively.
