

What do I want to learn or understand better? Consider e.g. teamwork, Scrum, agile processes, technologies etc?

I would like to gain a clear understanding of the best approach for me and my colleagues when one of us completes their user stories for the current sprint. Should we assist the remaining colleagues, bringing in new user stories from the product backlog, or focus on improving existing code? Currently, I am uncertain about the best approach.

Additionally, since our team is working on an application that involves an online database, I am interested in learning how to use Firebase. While I have experience creating applications with local databases, this will be my first time building one with an online database.

What is my contribution towards the team's deliveries? How can I help my team do better next sprint?

Nils Svanstedt and I are together responsible for developing the flashcard functionality in the current sprint. We engaged in pair-programming and successfully created a minimum viable product for the flashcards within the quiz application. As the Scrum Master, I have identified areas for improvement in our meetings. Our most recent meeting lasted for two hours and we were only able to achieve half of our intended goals. I will try to improve on being a Scrum Master and come up with a strategy to optimize our meetings and make them more efficient.

Changes/improvements from last week's reflection?  
Nothing, since it's the first sprint.
