

Team Reflection: Group 23 Sprint 5

The team has been doing great this sprint! Our focus has been to get the product to look as finished as possible, fixing small details that would otherwise give the users a worse experience. We have also added some functionality to connect the whole experience of the application by being able to save the user's results and score from quizzes. This worked out quite well since we avoided some merge conflicts, there were some areas like the login view which we had to manually fix. We feel as it has gotten easier over time with working more closely together, better planning, communicating and more efficiently.

We have continued to work as we did in the previous sprints with code reviews and some pair programming, however slightly less pair programming since we were able to split up a bunch of smaller tasks that needed to be done.

This sprint we managed to get an epic done (User Account), we finished the final user story (User accounts - change/update profile) on the epic. This added functionality for a user to be able to change their login details along with their user information.

Some of the user stories that we implemented this sprint was:

- (Epic) User Account - As a student I want to be able to create an account so that I can save my progress between devices
- (User accounts - change/update profile 2) - As a user of the application, I want to be able to change my profile information, such as password, so that I can keep my information up to date and secure.
- (Save taken quizzes 2) - As a competitive student, I want to be able to see my taken quizzes and my stats for them so that I can be encouraged to do better.

For the upcoming week, we have a last sprint that is on the shorter side. Therefore, we have planned not to add any major functionality features but rather fine-tune the application we already have in order for it to be in a presentable form that reflects our vision in a finished and usable product. Some of the fixes will include final decisions regarding navigation, refactorisation of the style sheets, completed responsive behavior and some sort of a system that takes advantage of the point counting we have created for the quizzes.
